Dynamic Programming (2)

By: Aminul Islam

Based on Chapter 3 of Foundations of Algorithms

Objectives

Objectives

- Describe the Dynamic Programming Technique
- Contrast the Divide and Conquer and Dynamic Programming approaches to solving problems
- Identify when dynamic programming should be used to solve a problem

$$\binom{n}{k} = \frac{n!}{k!(n-k)!}$$
 where $0 \le k \le n$

$$\binom{n}{k} = \frac{n!}{k!(n-k)!}$$
 where $0 \le k \le n$

• This is difficult to calculate for large values of *n*

$$\binom{n}{k} = \frac{n!}{k!(n-k)!}$$
 where $0 \le k \le n$

- This is difficult to calculate for large values of n
- We can eliminate the use of n! using the following formula:

$$\binom{n}{k} = \frac{n!}{k!(n-k)!}$$
 where $0 \le k \le n$

- This is difficult to calculate for large values of n
- We can eliminate the use of n! using the following formula:

$$\binom{n}{k} = \begin{cases} \binom{n-1}{k-1} + \binom{n-1}{k} & \text{if } 0 < k < n \\ 1 & \text{if } k = 0 \text{ or } k = n \end{cases}$$

```
Problem: Compute the binomial coefficient Inputs: nonnegative integers n and k, where k \le n Outpts: bin, the binomial coefficient \binom{n}{k} int bin (int n, int k) {

if (k == 0 || n == k)
return 1;
else
return bin(n-1, k-1) + bin(n-1, k);
}
```

$$\binom{n}{k} = \begin{cases} \binom{n-1}{k-1} + \binom{n-1}{k} & \text{if } 0 < k < n \\ 1 & \text{if } k = 0 \text{ or } k = n \end{cases}$$

```
Problem: Compute the binomial coefficient Inputs: nonnegative integers n and k, where k \le n Outpts: bin, the binomial coefficient \binom{n}{k} int bin (int n, int k) {

if (k == 0 || n == k)
return 1;
else
return bin(n-1, k-1) + bin(n-1, k);
}
```

$$\binom{n}{k} = \begin{cases} \binom{n-1}{k-1} + \binom{n-1}{k} & \text{if } 0 < k < n \\ 1 & \text{if } k = 0 \text{ or } k = n \end{cases}$$

```
Problem: Compute the binomial coefficient Inputs: nonnegative integers n and k, where k \le n Outpts: bin, the binomial coefficient \binom{n}{k} int bin (int n, int k) {

if (k == 0 || n == k)
return 1;
else
return bin(n-1, k-1) + bin(n-1, k);
}
```

What's the time complexity and order of complexity?

$$\binom{n}{k} = \begin{cases} \binom{n-1}{k-1} + \binom{n-1}{k} & \text{if } 0 < k < n \\ 1 & \text{if } k = 0 \text{ or } k = n \end{cases}$$

```
Problem: Compute the binomial coefficient Inputs: nonnegative integers n and k, where k \le n Outpts: bin, the binomial coefficient \binom{n}{k} int bin (int n, int k) {

if (k == 0 || n == k)
return 1;
else
return bin(n-1, k-1) + bin(n-1, k);
}
```

- What's the time complexity and order of complexity?
- D&C approach is not efficient. Why?

• Establish a recursive property

- Establish a recursive property
- Solve an instance in the bottom-up fashion

```
\binom{n}{k} = \begin{cases} \binom{n-1}{k-1} + \binom{n-1}{k} & \text{if } 0 < k < n \\ 1 & \text{if } k = 0 \text{ or } k = n \end{cases}
Problem: Compute the binomial coefficient Inputs: nonnegative integers n and k,
                                                         where k < n
                                                         Outpts: binD, the binomial coefficient
                                                         int binD (int n, int k)
                                                            index i, i;
                                                            int B[0..n][0..k];

```

Order of complexity is $\Theta(nk)$

Knapsack problem

Knapsack problem

Definition: Given items of different values and weights and a knapsack that can carry a fixed weight, find the most valuable set of items that fit in the knapsack.

Knapsack problem

Definition: Given items of different values and weights and a knapsack that can carry a fixed weight, find the most valuable set of items that fit in the knapsack.

Formal Definition: There is a knapsack of capacity W>0 and N items. Each item has value $v_i>0$ and weight $w_i>0$. Find the selection of items ($\delta_i=1$ if selected, 0 if not) that fit, $\sum_{i=1}^N \delta_i w_i \leq W$, and the total value, $\sum_{i=1}^N \delta_i v_i$, is maximized.

Knapsack problem

Definition: Given items of different values and weights and a knapsack that can carry a fixed weight, find the most valuable set of items that fit in the knapsack.

Formal Definition: There is a knapsack of capacity W>0 and N items. Each item has value $v_i>0$ and weight $w_i>0$. Find the selection of items ($\delta_i=1$ if selected, 0 if not) that fit, $\sum_{i=1}^N \delta_i w_i \leq W$, and the total value, $\sum_{i=1}^N \delta_i v_i$, is maximized.

There are two versions of the problem:

Knapsack problem

Definition: Given items of different values and weights and a knapsack that can carry a fixed weight, find the most valuable set of items that fit in the knapsack.

Formal Definition: There is a knapsack of capacity W>0 and N items. Each item has value $v_i>0$ and weight $w_i>0$. Find the selection of items ($\delta_i=1$ if selected, 0 if not) that fit, $\sum_{i=1}^N \delta_i w_i \leq W$, and the total value, $\sum_{i=1}^N \delta_i v_i$, is maximized.

There are two versions of the problem:

Fractional knapsack problem (Items are divisible) and

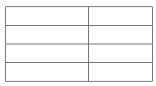

Knapsack problem

Definition: Given items of different values and weights and a knapsack that can carry a fixed weight, find the most valuable set of items that fit in the knapsack.

Formal Definition: There is a knapsack of capacity W>0 and N items. Each item has value $v_i>0$ and weight $w_i>0$. Find the selection of items ($\delta_i=1$ if selected, 0 if not) that fit, $\sum_{i=1}^N \delta_i w_i \leq W$, and the total value, $\sum_{i=1}^N \delta_i v_i$, is maximized.

There are two versions of the problem:

- Fractional knapsack problem (Items are divisible) and
- 0-1 knapsack problem (Items are indivisible)

^{* 1} means item is picked and 0 means item is not picked

Here, we went through all possible solutions/cases and picked the one that maximizes the value. This is known as Brute force What if W = 7? algorithm.

Optimization problems can have many possible solutions.

Optimization problems can have many possible solutions. Each solution has a value

Optimization problems can have many possible solutions. Each solution has a value, and we wish to find a solution with the optimal (minimum or maximum) value.

Optimization problems can have many possible solutions. Each solution has a value, and we wish to find a solution with the optimal (minimum or maximum) value. We call such a solution *an* optimal solution to the problem, as opposed to *the* optimal solution, since there may be several solutions that achieve the optimal value.
